

```
std::is_base_of< detail  
::type_caster_holder<  
base, holder >, detail  
::type_caster< holder > >
```

```
is_holder_type< base,  
holder >
```

A blue arrow points from the is_holder_type expression in the right box to the detail::type_caster_holder<base, holder> argument in the left box, indicating that is_holder_type is used to determine if holder is a base of the holder type.
